SafeHands Insurance Quote SPA

Client handover summary | Prepared for SafeHands Insurance Brokers | October 2026

Live site	https://safehands-insurance-quote.netlify.app
Source code	https://github.com/taimurniazi2498/safehands-deploy
Hosting	Netlify (free plan)
Built with	React, Vite, React Router

1. What this is

A website where visitors can learn about SafeHands and request an insurance quote online. It has three pages (Home, About and Quote) and works on phones, tablets and computers.

2. What visitors can do

- Fill in the quote form: full name, email, phone number and insurance type (Health, Auto, Home or Life).
- See helpful messages under each field while typing. Mistakes are explained in plain words, and the form works with a keyboard and screen readers.
- See a loading indicator while the quote is prepared, then a quote card with the estimated premium, coverage amount, deductible and a quote ID.
- If something goes wrong, see a friendly message and press **Try again** without filling in the form again.
- Switch between a light and a dark look with the sun/moon button. The site remembers the choice on the next visit.

3. How changes go live

Every change to the code is checked automatically before it is published. If any check fails, the site is **not** updated, so a broken change cannot reach visitors.

- **Checks:** code style check, 34 automated tests, a production build and an end-to-end test that fills in the quote form in a real browser.
- **Publishing:** when all checks pass on the main branch, the site is published to Netlify automatically.
- **Status:** the green "CI passing" badge at the top of the repository page shows the latest result.

4. Quality results

Measure	Result
Google Lighthouse (Performance, Accessibility, Best Practices)	100 / 100 / 100
Automated unit tests	34 passing, about 98% of statements covered
End-to-end tests (browser)	4 passing

5. Important things to know

- **Quotes are a demonstration.** The quote service is a public test service and the amounts on the quote card come from a simple demo formula. Before real customers rely on them, the site must be connected to SafeHands' real quoting system.
- **Nothing is stored.** Information typed into the form is not saved or sent to SafeHands in this version.
- **Theme choice** is kept only in the visitor's own browser.

6. Maintenance tips

- Before changing anything, run the checks on a computer (`npm run lint`, `npm test`, `npm run build`). The same checks run automatically after every change.
- Once in a while, look for outdated packages with `npm outdated` and update them in a separate change, so any problem is easy to trace.
- Publishing uses a Netlify access token stored as a secret in GitHub. If it expires, create a new one in Netlify and replace the `NETLIFY_AUTH_TOKEN` secret.
- To go back to an earlier version of the site, open Netlify, choose Deploys, pick an older deploy and press **Publish deploy**.
- A custom web address (for example www.safehands.example) can be added in Netlify under Domain management.

7. Where to find more

The **README** in the repository explains how to set up the project, run the tests and deploy it, with every command in one place. Start there when handing the project to another developer.
